

## CSCI 572 Homework 4 (Reuters)

Shuming Hao

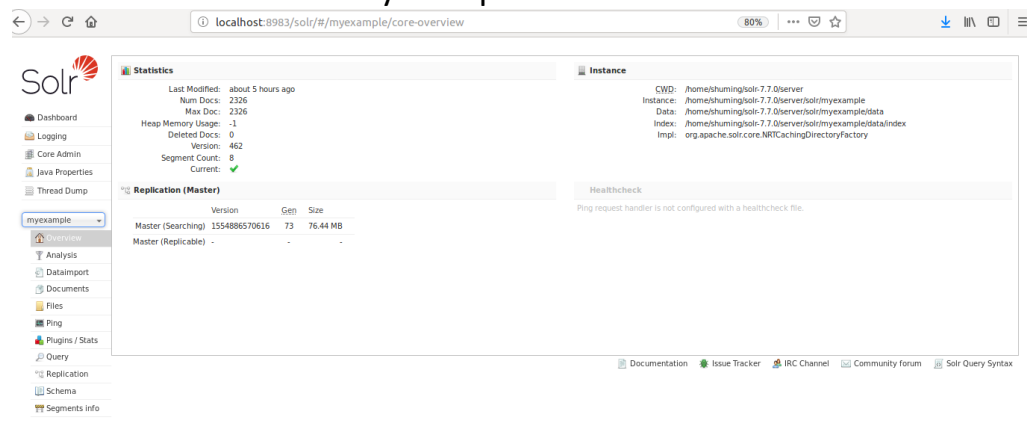

1547131193

### Steps to complete the assignment

1. Download and unzip Solr from given link, use command `$ bin/solr start` to start solr.
2. Create a core named **myexample** on Solr using command `$ bin/solr create -c myexample`.
3. Change Solr config file **managed-schema** as below:

```
<field name="id" type="string" indexed="true" stored="true" required="true" multiValued="false" />
<field name="_version_" type="long" indexed="true" stored="true"/>
<field name="_root_" type="string" indexed="true" stored="false"/>
<field name="_text_" type="text_general" indexed="true" stored="false" multiValued="true"/>
<copyField source="*" dest="_text_" />
```

4. Indexing HTML files in Solr, run command `$ bin/post -c <core_name> -filetypes html <path_to_crawl_folder>/`
5. Open Solr UI on browser via <http://localhost:8983/solr/>, here is the overview of the core “myexample”

6. Configure Solr to default querying from the field `_text_` by defining the default field in the requestHandler in the `solrconfig.xml` file. reload core and query with the new configuration.

```
<requestHandler name="/select" class="solr.SearchHandler">
  <!-- default values for query parameters can be specified, these
       will be overridden by parameters in the request -->
  <lst name="defaults">
    <str name="echoParams">explicit</str>
    <int name="rows">10</int>
    <str name="df">_text_</str>
  </lst>
</requestHandler>
```

7. `git clone https://github.com/PTCInc/solr-php-client.git`
8. Create a new php file `sudo gedit /var/www/html/index.php`
9. Modify the code from the example for the assignment.
10. Write Java code. Use JSOUP library to create an edgelist file. Save this file as input for calculating pagerank values.
11. Write Python code. Use networkx library to generate graph from given edgelist generated by Java code to calculates pagerank of each website.  
*The parameters are:*  
*alpha=0.85, personalization=None, max\_iter=30, tol=1e-06, nstart=None, weight='weight', dangling=None*
12. Save pagerank values in a file named `external_pageRankFile.txt`
13. Copy `external_pageRankFile` to the core created on Solr.
14. Modify `managed-schema` file by add two lines of code as instructed:  
The next step is to add the field in the `managed-schema` which refers to this score.

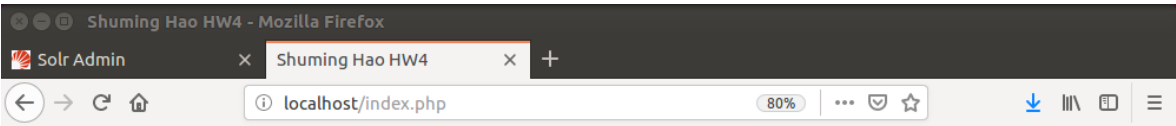

```
<fieldType name="external" keyField="id" defVal="0" class="solr.ExternalFileField"/>
<field name="pageRankFile" type="external" stored="false" indexed="false"/>
```

15. Define these listeners within the `<query>` element in the `solrconfig.xml` file.

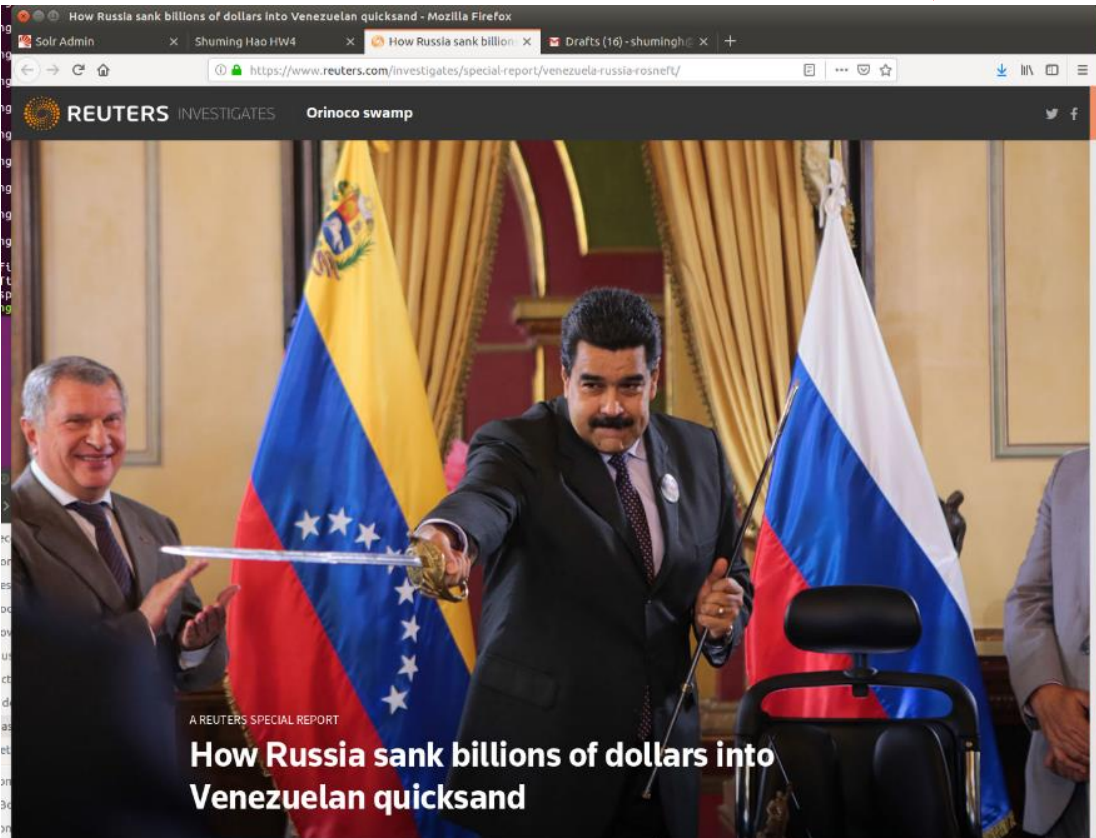

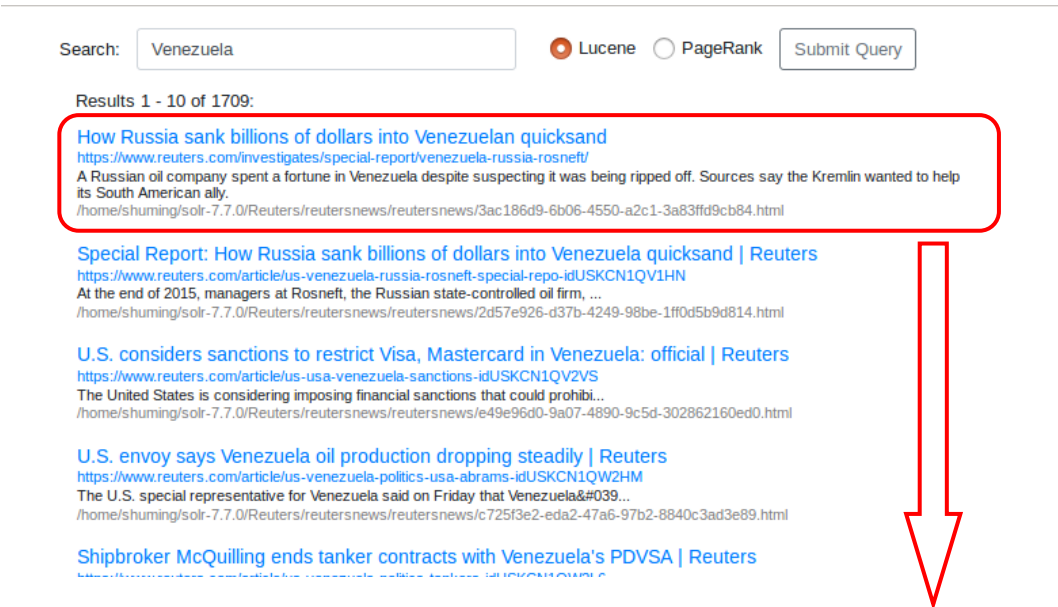

```
<listener event="newSearcher" class="org.apache.solr.schema.ExternalFileFieldReloader"/>  
<listener event="firstSearcher" class="org.apache.solr.schema.ExternalFileFieldReloader"/>
```

16. Reload Solr from Solr UI.

17. Here is the initial page wherewe enter the query in input box.

18. Here is the screenshot of an clickable page.

Why some pages have higher PageRank values than others.

PageRank is calculated from the number of external links pointing to the webpage. each web page has different numbers of external links that point to this page, so that each page has a different score. The formula is shown below:

$$PR(A) = (1-d) + d (PR(T1)/C(T1) + ... + PR(Tn)/C(Tn))$$

- PR(A) is PageRank of Page A (one we want to calculate)
- PR(T1) is the PageRank of Site T1 pointing to page A
- C(T1) is the number of outgoing links of page T1

From both the formula and the query results, we can find out that a page which is most pointed to from many other pages will have higher PageRank value. For example, the homepage <http://www.reuters.com> has the highest PageRank value of around 0.03. Since it is reachable from most pages, which gives it a high indegree. Thus, it has a high PageRank value.
